B25ET1005 DSA Practical - 6

FAQ's.

1) What is Queue?
→ Queue is linear data structure in which data can be inserted from rear end and deleted from front end.

2) How queue is represented?
→ Queue can be represented using array & linked list.

3) Enlist types of queues
→ 1) Linear queue.
2) Circular queue.
3) Priority queue.

4) What is the concept of circular queue?
→ In a circular queue last node is connected back to first node to make a circle.

5) Applications of Queue.
→ 1) Categorizing the data.
2) Queue simulation.

6) What is priority queue?
→ A priority queue is a collection of elements where each element is assigned a priority & the order in which elements are deleted & processed is determined from the following rules -
1) An element of higher priority is processed

before any element of lower priority.
2) Two elements with the same priority are process-ed acc to their order, in which they are added to queue.

7) What is dequeue?
→ The term dequeue is contraction of name double-ended-queue. It is a linear list in which elements can be added or removed at either end but not in the middle.
