B25ET1005 OOP. Practical-10

FAQ's

1) What is an exception?
→ An abnormal runtime condition that disrupts normal execution.

2) What is the purpose of try block?
→ To enclose code that migh throw an exception.

3) What does throw do?
→ It signals an error by generating an exception object.

4) How is a matching catch block selected?
→ By matching the type of the thrown exception.

5) What is the advantage of using standard exception classes such as runtime_error?
→ They provide built-in diagnostic messaging & a consistent error hierarchy.

6) Explain different run-time exceptions likely in a C++ program.
→ Examples include division by zero & memory allocation failures.

7) Can We write multiple catch blocks for a single try block?
→ Yes, to handle different specific exception types.
