B2SET1005 OOP, Practical-12.

FAQ's

1) What is a namespace?
→ A declarative region that groups identifiers to prevent name collisions.

2) Why are namespaces useful in large programs?
→ They prevent naming conflicts between different libraries & modules.

3) What does the scope resolution operator (::) do?
→ It specifies the namespace or class scope of an identifier.

4) What is the std namespace?
→ The standard namespace containing C++ standard library features and objects.

5) What is the difference between a using declaration & a using directive?
→ Declarations introduce a single specific name, whereas directives introduce all names from a namespace.
