B2SETI00S OOP, Practical - 2

FAQ's.

1) What does the modulo operator return?
→ The modulo operator (%) returns the remainder of an integer division.

2) How is an even number detected in C++?
→ An even number is detected using logic num % 2 == 0.

3) What is a reference variable in C++? Explain with help of examples.
→ A reference variable is an alias for an existing variable, declared using &
eg int x = 10; int &ref = x; where, ref directly accesses x)

4) Can the same result be obtained by incrementing the loop by 2?
→ Yes, incrementing a loop by 2 (eg i+ = 2) can skip alternate numbers to directly generate only even or odd numbers faster.

5) What changes are needed to find the sum of odd numbers?
→ Initialize the starting loop counter to 1 instead of 0 or update the condition to check for num % 2 != 0

6) What is a statement terminator in C++?
→ The semicolon (;) is used as a statement terminator to mark the end of an executable statement.

7) Explain the functionalities of cin & cout operators in C++.

→ cin reads inputs from the std I/p stream (keyboard) using >>, while cout writes/prints o/p to the std o/p stream (console) using <<.

8) Why do we need to include the iostream header file in a C++ program?

→ <iostream> provides declarations for std I/p & o/p stream objects like cin, cout & cerr.
