B25ET1005 OOP, Practical-3.

FAQ's.

1) What is call by reference?
→ It is a parameter passing mechanism where a reference to the actual variable is passed to the function, allowing direct modification of original value.

2) Why is the ampersand(&) used in swapValue() parameters?
→ It demotes that the parameters are reference variables, making them aliases for the original variables passed from the caller.

3) What is the role of constant keyword in displayArray()?
→ It prevents the function from modifying the passed array, ensuring safety & read-only access.

4) What is the time complexity of bubble sort?
→ It has a worst case and best case time complexity of $O(n^2)$.

5) Why is modular programming useful?
→ It breaks a large problem into small, manageable & reusable functions that are easier to understand test & maintain.

6) Explain with example the concept of reference variable in C++.

→ A reference variable (eg int &y = x;) binds to an existing variable y & x share the same memory location.
