B25ET1005 OOP. Practical - 7.

FAQ's.

1) What is the purpose of a constructor?
→ To initialize an object's state and allocate necessary resources when the object is created.

2) When is a destructor called?
→ Automatically when an object reaches the end of its scope or lifetime.

3) What is a deep copy & why is it required here?
→ It allocates independent memory and copies actual contents so that objects do not share raw pointers, preventing double deletion issues.

4) What is the purpose of a destructor? Why is delete[] used in the string-class experiment?
→ A destructor releases allocated resources. & delete[] is used to safely free dynamically allocated character arrays created with new[].

5) What problem can occur if the compiler-generated copy constructor is used with raw pointers?
→ It creates a shallow copy where multiple objects point to the same memory, causing issues like double deletion & unintended side effects.

6) Explain different types of constructors with help of examples.

→ Types include.
1) default constructors : eg)
2) parameterized constructor : eg)
3) Copy constructor : eg)
Used for initialization of objects in distinct ways.

7) Explain constructor overloading in detail.

→ It involves defining multiple constructors within a class having different parameter lists to allow flexible object initialization.
